

CIRCULAR SOFFIT VENTS

Soffits connect your roof overhang to the side of your house. They provide coverage and protection, protecting the eaves and rafters from the elements of the weather. Not only do they prevent damage, they also improve the appearance of a roof and eliminate any potential mould, rot, and other forms of moisture damage. To improve the ventilation in your attic, you can install Circular Soffit Vents:

1. Our Circular Soffit Vents are available in 5 colours. Select the colour that will compliment the aesthetics of the building.
2. Use to ventilate roofs with a pitch of 15 degrees or more. Do not use on pitches less than this or where living accommodation is contained within the roof space.
3. Space at 250mm centres.
4. Cut into the soffit with a circular saw or a saber saw. Take care to ensure the fixing holes are cut accurately with a diameter of 68mm. If the holes are oversize, the ventilators will not fix securely.
5. Push & click firmly into the soffit.

HOW FAR APART SHOULD SOFFIT VENTS BE?

Most professionals recommend one square foot of ventilation for every 150 square feet of attic area. This will help you determine how many soffit vents you need.
